BizzFrame

Technical brief

BizzFrame gives a business a clear picture of its structure: departments, positions and the people who fill them.

1. Architecture in brief

BizzFrame is a CloudWinks app in the Operations and workforce group. Each record belongs to a company, and other companies cannot see it. It builds on Crux. Its screens, fields and menus are definitions, built by the same pipeline as every other CloudWinks app.

2. Service boundary and intake

BizzFrame owns its own records. People and companies come from Crux rather than a separate user list, files are stored in MediaMogul and linked, and work that belongs to another app opens in that app.

3. Data handled

Organisational structures, departments, positions and employee records.

4. Integrations and ownership

BizzFrame uses the shared Crux record for every employee and company, so a person’s HR record and their identity across the platform are the same.

5. Security and access

Sign-in, roles and permissions come from KeyKook, and people and companies come from Crux. Each record belongs to a company, and other companies cannot see it. Any record shown through another app, a portal or a combined view still passes that app’s permission check, and money, security and company-account work always runs on the server.
