CLOUDWINKS · FOUNDATION APPS

CosmosCall

Business brief

CosmosCall organizes the connections between CloudWinks and outside software. It captures how services exchange information so teams can reuse connection definitions instead of rebuilding each integration from scratch.

1. What it does and why it matters

CosmosCall keeps a catalogue of service providers, connection details and information formats. It describes how requests and responses map between systems and includes connection-test information. This gives integrations a common structure and makes repeated connection work easier to manage. Each connection to an outside service, such as Google, uses a KeyKook connected account that belongs to a person or a company, and other people and companies cannot see it. CosmosCall points to that account, and secrets live only in KeyKook.

2. How the apps work together

Roady uses mapping and calls for location services; MediaMogul uses the connection model for its own integrations. KeyKook supplies protected credentials. TheIntegrator is the shared conversion/execution service, keeping information transformation separate from the catalogue of outside connections.

3. Using it with outside applications

CosmosCall's external error-reporting design lets another application make a call that becomes a Murphy error report. The outside app uses the connection service without adopting unrelated CloudWinks business apps. CosmosCall describes the connection, TheIntegrator adapts the information and Murphy keeps the problem record.

4. Other choices and the CloudWinks fit

ALTERNATIVE	ITS FOCUS	CLOUDWINKS PRODUCT FOCUS
Postman	API cataloguing, design, testing and monitoring.	Connection definitions tied to CloudWinks applications and shared services.
n8n Webhook	Incoming events that start configured workflows.	A focused connection model with shared mapping and business-app context.

5. Building a competitive edge

Give teams a reusable, business-aware connection model rather than a collection of one-off scripts. Make the path from an outside event to its business outcome easy to follow. Prioritize well-defined integrations and useful diagnostics over the size of the connection catalogue.
