ProcureFlow

Business brief

ProcureFlow turns purchasing into a clear, controlled workflow, from the first requisition through approval to the purchase order and the vendor who fills it.

1. What it does

ProcureFlow manages procurement and purchasing. It keeps the vendor list, processes requisitions, routes them through approval workflows and tracks each purchase order, giving finance and operations one view of what is being bought, from whom and on whose authority.

2. Main features

- Vendor management
- Requisition processing
- Approval workflows
- Purchase order tracking
- Procurement operations for businesses and organizations

3. How it works with other applications

ProcureFlow uses the shared Crux record for vendors and staff, so a supplier is one company record across the platform. Every item it manages also uses the CloudWinks base functions: media through MediaMogul, role players, dates and times, ratings, budgets, transactions and a status flow. Each base function opens the controls in the app that owns them, so nothing is duplicated.
