StableKidz

Business brief

StableKidz runs a riding stable and its youth programmes: lessons, students, the horses they ride and the billing that goes with it.

1. What it does

StableKidz is the management application for riding stables and equestrian education programmes. It schedules lessons, tracks students, assigns horses, manages programmes and handles billing. StableKidz is part of the CloudWinks agriculture and equine group. Riders' health details are kept in MiSalud, the central health record, rather than in the stable's own records.

2. Main features

- Lesson scheduling
- Student tracking
- Horse assignment
- Program management
- Billing
- Operations for riding stables and equestrian education programs

3. How it works with other applications

StableKidz sits in the agriculture and equine group with HorseStudbook and FoalFactory. Health information comes from MiSalud, the central health record. Every item it manages also uses the CloudWinks base functions: media through MediaMogul, role players, dates and times, ratings, budgets, transactions and a status flow. Each base function opens the controls in the app that owns them, so nothing is duplicated.
