CloudWinks

CLOUDWINKS · AGRICULTURE & EQUINE

StockMan

Technical brief

StockMan manages livestock from the individual animal to the herd, and connects the operation to the books through BeanCounter.

1. Architecture in brief

StockMan is a CloudWinks app in the Agriculture and equine group. A record can belong to a person or to a company, and other people and companies cannot see it. It builds on Crux. Its screens, fields and menus are definitions, built by the same pipeline as every other CloudWinks app.

2. Service boundary and intake

StockMan owns its own records. People and companies come from Crux rather than a separate user list, files are stored in MediaMogul and linked, and work that belongs to another app opens in that app.

3. Data handled

Animals and herds, health records, breeding records, inventory and feed.

4. Integrations and ownership

StockMan connects to BeanCounter for the financial management of livestock operations, and sits alongside FarmDance in the agriculture group.

5. Security and access

Sign-in, roles and permissions come from KeyKook, and people and companies come from Crux. A record can belong to a person or to a company, and other people and companies cannot see it. Any record shown through another app, a portal or a combined view still passes that app’s permission check, and money, security and company-account work always runs on the server.
