Surfy

Business brief

Surfy is a lightweight control panel, built on the CloudWinks framework, that puts servers, APIs, databases and websites in one simple place.

1. What it does

Surfy simplifies server and API management. From one control panel a team manages its API services and PostgreSQL databases, monitors its servers, manages firewalls and hosts websites, including WordPress sites. Problems are reported to Murphy, the platform's error service.

2. Main features

- API service management
- PostgreSQL database management
- Server monitoring
- Firewall management
- Website hosting with WordPress support
- Murphy error management integration

3. How it works with other applications

Surfy is built on the CloudWinks framework itself and reports errors to Murphy, so hosting issues appear alongside every other application's errors. Every item it manages also uses the CloudWinks base functions: media through MediaMogul, role players, dates and times, ratings, budgets, transactions and a status flow. Each base function opens the controls in the app that owns them, so nothing is duplicated.
