UseAbit

Business brief

UseAbit makes shared assets and facilities easy to book and easy to account for, so they are used well rather than left idle.

1. What it does

UseAbit manages resources that people or organisations share. It handles asset sharing and booking, schedules availability and tracks how much each resource is used, giving owners a clear view of demand and utilisation for every shared asset and facility.

2. Main features

- Asset sharing
- Booking management
- Availability scheduling
- Utilization tracking
- Resource management for shared assets and facilities

3. How it works with other applications

UseAbit uses the shared Crux record for owners and borrowers, so each booking is tied to the same person or company used everywhere else. Every item it manages also uses the CloudWinks base functions: media through MediaMogul, role players, dates and times, ratings, budgets, transactions and a status flow. Each base function opens the controls in the app that owns them, so nothing is duplicated.
